

Date: December 4, 2025

1. Design an accelerator which performs FFT followed by another FFT on input data comprising of 8 complex samples of float data type.
 - A. Implementation on processor and display the execution time **(2 Mark)**
 - B. Implementation on PL, compare PS and PL outputs and display the execution time **(10 marks: 1 Mark for FFT)**
 - C. Demonstrate the outputs of both FFT on ILA **(3 marks)**
